DeSilva, RN, and Indrani Amarasinghe, FRCS *Pain Management and Anesthesia (J.E.W., A.C.), Royal Marsden NHS Trust, London, United Kingdom; and Government Cancer Institute (R.R., B.S.S.D., I.A.) Maharagama, Sri Lanka*

Abstract

This paper describes a project for the establishment of a cancer pain clinic in a developing country. The project was conducted according to guidelines from the World Health Organization and utilized a link with an existing cancer pain clinic in the UK. The principal methods used for establishing the new pain clinic included: an assessment of barriers to effective cancer pain control, teaching programs for nurses and trainee doctors, educational links with a UK cancer pain clinic, and analgesic guidelines and introduction of a pain assessment tool. As a result of these interventions, a new cancer pain clinic was founded. The methods used serve as one possible model for establishing cancer pain treatment facilities in developing countries.
